

Turn on the web server service on macOS

Apache webserver is shipped with all macOS version. The newer macOS version no longer provides user interface to control the webserver. Geeks who know Linux can turn on and off the webserver easily through the command line client. The following article on Apple community provides a step by step tutorial to do this.

[Setting up a local web server on macOS 10.13 "High Sierra"](#)

After you follow the above article to turn on your webserver. You can find the all software is up to date and ready to use. The latest PHP version is 7.1.7.
